Scoring and interpretation: Total the scores: The total MDS-16 score is calculated as the average of the 16 item scores, with a range from 0 to 100. 40 or higher: Indicates suspected clinical-level maladaptive daydreaming. 39 or below: These scores suggest that the individual's daydreaming habits are within a normal range and are not causing distress or impairment in daily functioning. The MDS-16 is an open access measure and can be used without charge, but the developers request that any research paper or publication that uses it share its results with the International Consortium for Maladaptive Daydreaming Research.
